

# INTEGRATED FLOOR SYSTEMS

LEVEL 2 POLISHED CONCRETE: SATIN FINISH

The IFS level 2 system produces a matte to satin sheen for concrete floors. This flooring option greatly enhances old floors and makes new floors look fantastic. Many retailers use this option on new floors because it produces a great surface sheen, provides an easily maintainable surface, and is extremely affordable compared to other flooring options such as VCT that needs constant waxing. Color / Dye can be added to this option to add a translucent color to the floor which gives the customer some design autonomy for their facility.

## PROCESS INCLUDES

- Cleaning of the floor, repairs as requested.
- At least 2 diamond tool steps, application of an impregnating concrete hardener/densifier.
- An optional application of a final floor guard for added spill and stain protection.
- Level 2 provides a matte to satin finish sheen level, typically 10 to 20 points on a 60-degree gloss meter. (new floors poured and finished correctly may see higher numbers)
- ***Color dye can be added to this system. (Our color goes "into" the floor, not just staining the top like other systems")***
